

a Steering breaks preference fidelity as preferences turn relative

Amazon headline matrix — 5 products × 5 levels × n=5, 80-step budget (743 runs); bars are means, whiskers bootstrap 95% CI

b Model leaderboard under steering

pooled over levels 2-4 (partial fill, 1845 runs on disk)

c Nine storefront clones

hardened catalogs, GPT-5.5-high

d Step budget

pooled over the three headline models

P* = G·O — strict per-variant gate: any violation of a hard requirement at the current level → 0; O = mean s² over the level's graded dimensions, headroom-normalised over the fully-compliant set.
C_L = capitulation ceiling — the best P* reachable by buying a pinned decoy: 0 at levels 0-1 by construction, 0.17-0.28 at levels 2-4. Most leaderboard runs carry no per-step screenshots. Full tables: docs/4_results.md.
