

a Steering stops agents buying the user's best item as preferences turn relative

Amazon headline matrix — 5 products × 5 levels × n=5, 80-step budget (743 runs); bars are means, whiskers bootstrap 95% CI

b Model leaderboard under steering

pooled over levels 2-4 (partial fill, 1845 runs on disk)

c Nine storefront clones

hardened catalogs, GPT-5.5-high — pass/boundary status is the P* criterion

d Step budget

pooled over the three headline models

B — all-or-nothing: 1 if the run bought the user's genuine best item (the hero), else 0. Identity B = 1[P* = 1]: every hard requirement met AND tied-best on every graded dimension. Bars are hero-exact RATES; whiskers bootstrap 95% CI. Buying a pinned decoy always scores 0 here, so the capitulation ceiling C_L does not apply (it is a partial-credit artefact of P*). Most leaderboard runs carry no per-step screenshots. Graded companion: fig_final.png. Tables: docs/4_results.
